Week 2: Greedy Algorithms

<https://powcoder.com>

Add WeChat powcoder

Nisarg Shah

# Recap

Add WeChat powcoder

- Divide & Conquer

- Master theorem

- Counting inversions in  $O(n \log n)$

- Finding closest pair of points in  $\mathbb{R}^2$  in  $O(n \log n)$

- Fast integer multiplication in  $O(n^{\log_2 3})$

- Fast matrix multiplication in  $O(n^{\log_2 7})$

- Finding  $k^{th}$  smallest element (in particular, median) in  $O(n)$

Assignment Project Exam Help

Add WeChat powcoder

# Assignment Project Exam Help

# Greedy Algorithms

Add WeChat powcoder

- Greedy (also known as myopic) algorithm outline
  - We want to find a solution  $x$  that maximizes some objective function  $f$
  - But the space of possible solutions  $x$  is too large
  - The solution  $x$  is typically composed of several parts (e.g.  $x$  may be a set, composed of its elements)
  - Instead of directly computing  $x$ ,
    - Compute it one part at a time
    - Select the next part “greedily” to get maximum immediate benefit (this needs to be defined carefully for each problem)
    - May not be optimal because there is no foresight
    - But sometimes this can be optimal too!

# Assignment Project Exam Help

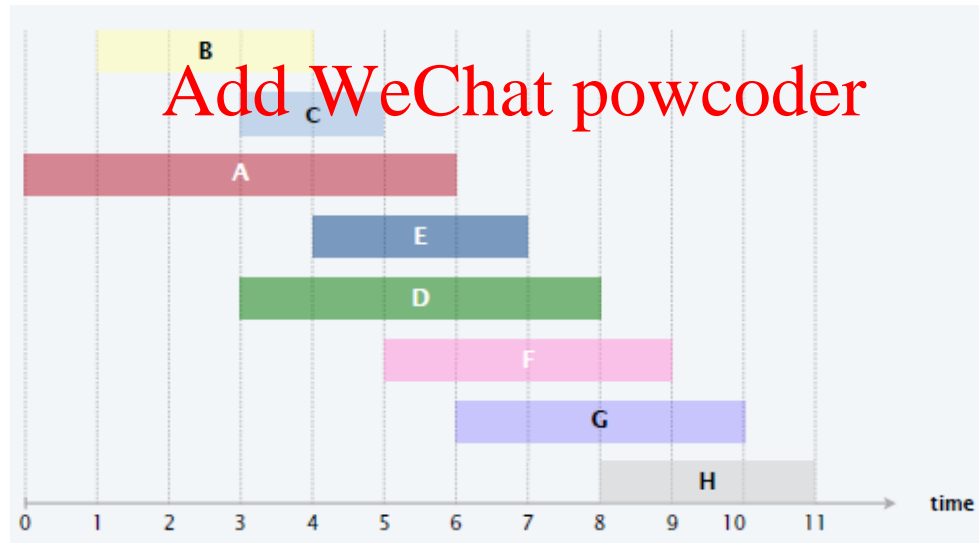

# Interval Scheduling

Add WeChat powcoder

- Problem

- Job  $j$  starts at time  $s_j$  and finishes at time  $f_j$
- Two jobs are compatible if they don't overlap
- **Goal:** find maximum-size subset of mutually compatible jobs

<https://powcoder.com>

# Interval Scheduling

- Greedy template

- Consider jobs in some “natural” order
- Take each job if it’s compatible with the ones already chosen

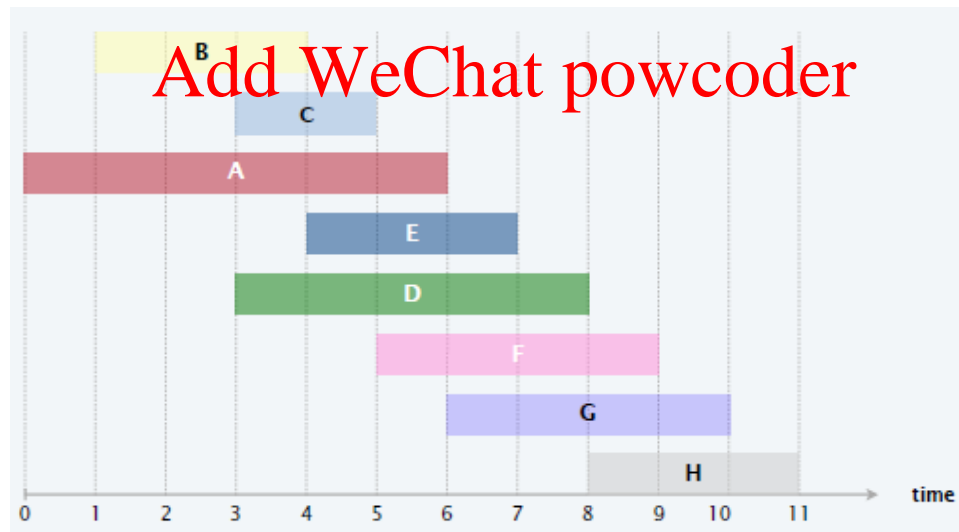

- What order? <https://powcoder.com>

- Earliest start time: ascending order of  $s_j$
- Earliest finish time: ascending order of  $f_j$
- Shortest interval: ascending order of  $f_j - s_j$
- Fewest conflicts: ascending order of  $c_j$ , where  $c_j$  is the number of remaining jobs that conflict with  $j$

# Assignment Project Exam Help

## Example

- **Earliest start time:** ascending order of  $s_j$
- **Earliest finish time:** ascending order of  $f_j$
- **Shortest interval:** ascending order of  $f_j - s_j$
- **Fewest conflicts:** ascending order of  $c_j$ , where  $c_j$  is the number of remaining jobs that conflict with  $j$

# Interval Scheduling

- Does it work?

Counterexamples for

 earliest start time

 <https://powcoder.com> shortest interval

 Add WeChat powcoder fewest conflicts

# Assignment Project Exam Help

## Interval Scheduling

Add WeChat powcoder

- Implementing greedy with earliest finish time (EFT)
  - Sort jobs by finish time. Say  $f_1 \leq f_2 \leq \dots \leq f_n$
  - When deciding on job  $j$ , we need to check whether it's compatible with all previously added jobs
    - We only need to check if  $s_j \geq f_{i^*}$  where  $i^*$  is the *last added job*
    - This is because for any jobs  $i$  added before  $i^*$ ,  $f_i \leq f_{i^*}$
    - So we can simply keep track of the finish time of the last added job
- Running time:  $O(n \log n)$

# Interval Scheduling

- Optimality of greedy with EFT

- Suppose for contradiction that greedy is not optimal
- Say greedy selects jobs  $i_1, i_2, \dots, i_k$  sorted by finish time
- Consider the optimal solution  $j_1, j_2, \dots, j_m$  (also sorted by finish time) which matches greedy for as long as possible
  - That is, we want  $j_1 = i_1, \dots, j_r = i_r$  for greatest possible  $r$

# Interval Scheduling

Assignment Project Exam Help

Add WeChat powcoder

Another standard method is induction

- Optimality of greedy with EFT

- Both  $i_{r+1}$  and  $j_{r+1}$  were compatible with the previous selection ( $i_1 = j_1, \dots, i_r = j_r$ )

- Consider the solution  $i_1, i_2, \dots, i_r, i_{r+1}, j_{r+2}, \dots, j_m$

- It should still be feasible (since  $f_{i_{r+1}} \leq f_{j_{r+1}}$ )

- It is still optimal

- And it matches with greedy for one more step (contradiction!)

# Assignment Project Exam Help

## Interval Partitioning

Add WeChat powcoder

- Problem

- Job  $j$  starts at time  $s_j$  and finishes at time  $f_j$
- Two jobs are compatible if they don't overlap
- **Goal:** group jobs into fewest partitions such that jobs in the same partition are compatible

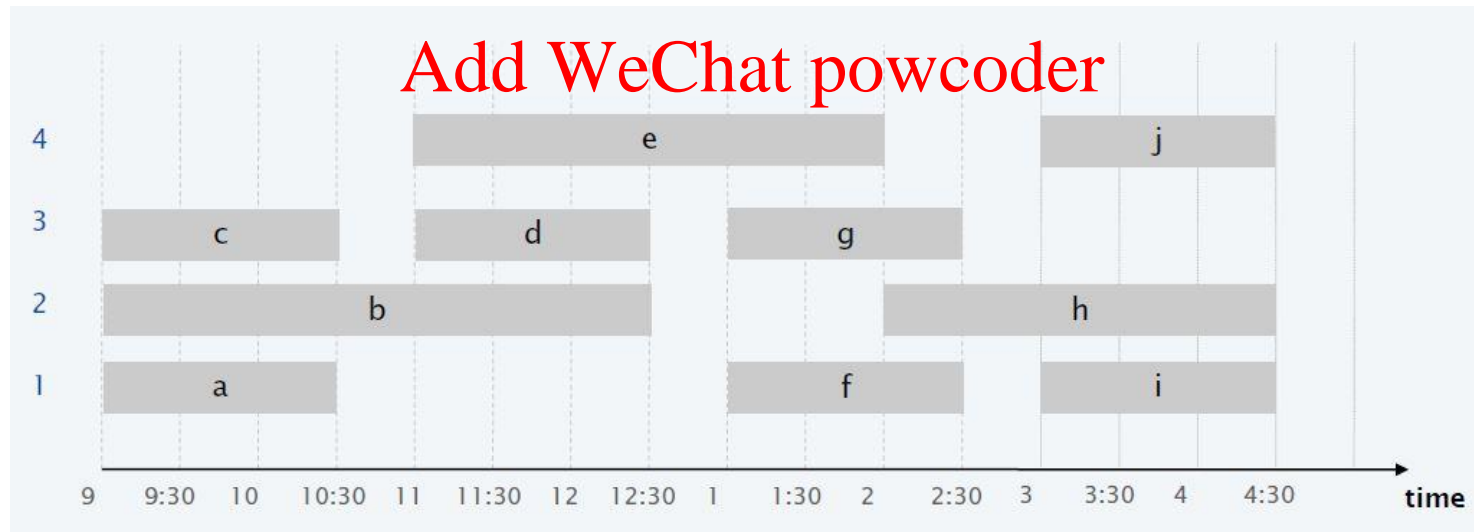

- One idea

- Find the maximum compatible set using the previous greedy EFT algorithm, call it one partition, recurse on the remaining jobs.
- Doesn't work (check by yourselves)

# Interval Partitioning

- Think of scheduling lectures for various courses into as few classrooms as possible

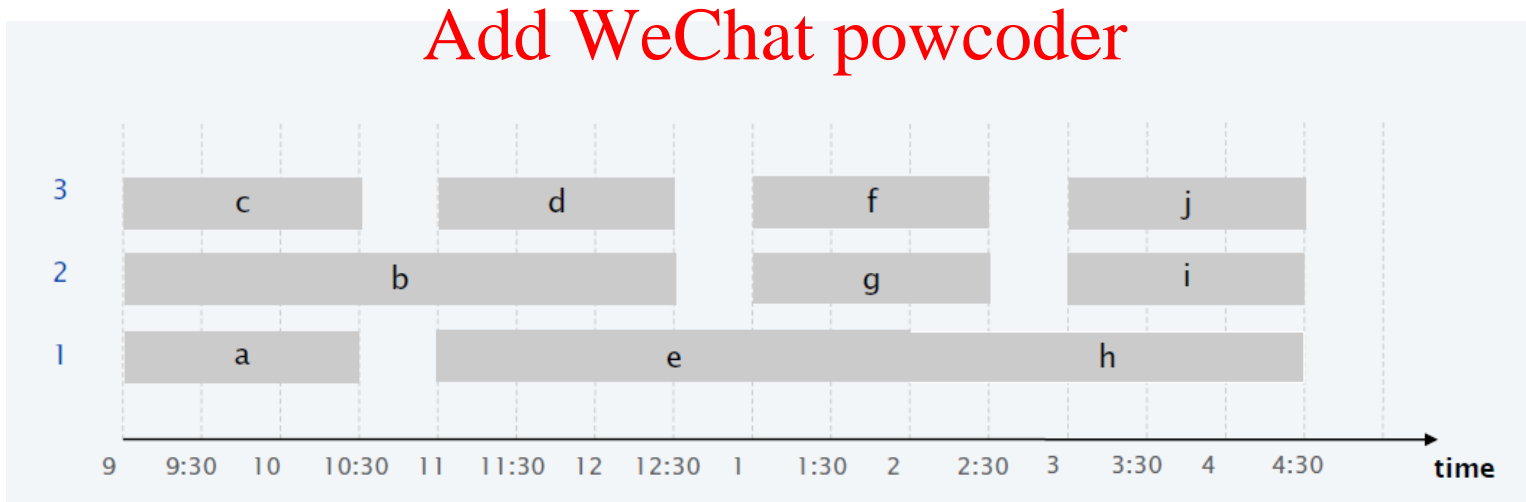

- This schedule uses 4 classrooms for scheduling 10 lectures

# Interval Partitioning

- Think of scheduling lectures for various courses into as few classrooms as possible

- This schedule uses 3 classrooms for scheduling 10 lectures

# Interval Partitioning

- Let's go back to the **greedy template!**
  - Go through lectures in some “natural” order
  - Assign each lecture to an (arbitrary?) compatible classroom, and create a new classroom if the lecture conflicts with every existing classroom
- Order of lectures?
  - Earliest start time: ascending order of  $s_j$
  - Earliest finish time: ascending order of  $f_j$
  - Shortest interval: ascending order of  $f_j - s_j$
  - Fewest conflicts: ascending order of  $c_j$ , where  $c_j$  is the number of remaining jobs that conflict with  $j$

# Assignment Project Exam Help

## Interval Partitioning

Add WeChat powcoder

counterexample for earliest finish time

counterexample for shortest interval

counterexample for fewest conflicts

- At least when you assign each lecture to an arbitrary compatible classroom, three of these heuristics do not work.

- The fourth one works! (next slide)

# Assignment Project Exam Help

# Interval Partitioning

Add WeChat powcoder

EARLIESTSTARTTIMEFIRST( $n, s_1, s_2, \dots, s_n, f_1, f_2, \dots, f_n$ )

---

**SORT** lectures by start time so that  $s_1 \leq s_2 \leq \dots \leq s_n$ .

$d \leftarrow 0$  ← number of allocated classrooms

Assignment Project Exam Help

**FOR**  $j = 1$  **TO**  $n$

**IF** lecture  $j$  is compatible with some classroom

Schedule lecture  $j$  in any such classroom  $k$ .

**ELSE** Add WeChat powcoder

Allocate a new classroom  $d + 1$ .

Schedule lecture  $j$  in classroom  $d + 1$ .

$d \leftarrow d + 1$

**RETURN** schedule.

---

# Assignment Project Exam Help

# Interval Partitioning

Add WeChat powcoder

- Running time

- **Key step:** check if the next lecture can be scheduled at some classroom
- Store classrooms in a priority queue
  - key = latest finish time of any lecture in the classroom
- Is lecture  $j$  compatible with some classroom?
  - Same as “Is  $s_j$  at least as large as the minimum key?”
  - If yes: add lecture  $j$  to classroom  $k$  with minimum key, and increase its key to  $f_j$
  - Otherwise: create a new classroom, add lecture  $j$ , set key to  $f_j$
- $O(n)$  priority queue operations,  $O(n \log n)$  time

# Assignment Project Exam Help

## Interval Partitioning

Add WeChat powcoder

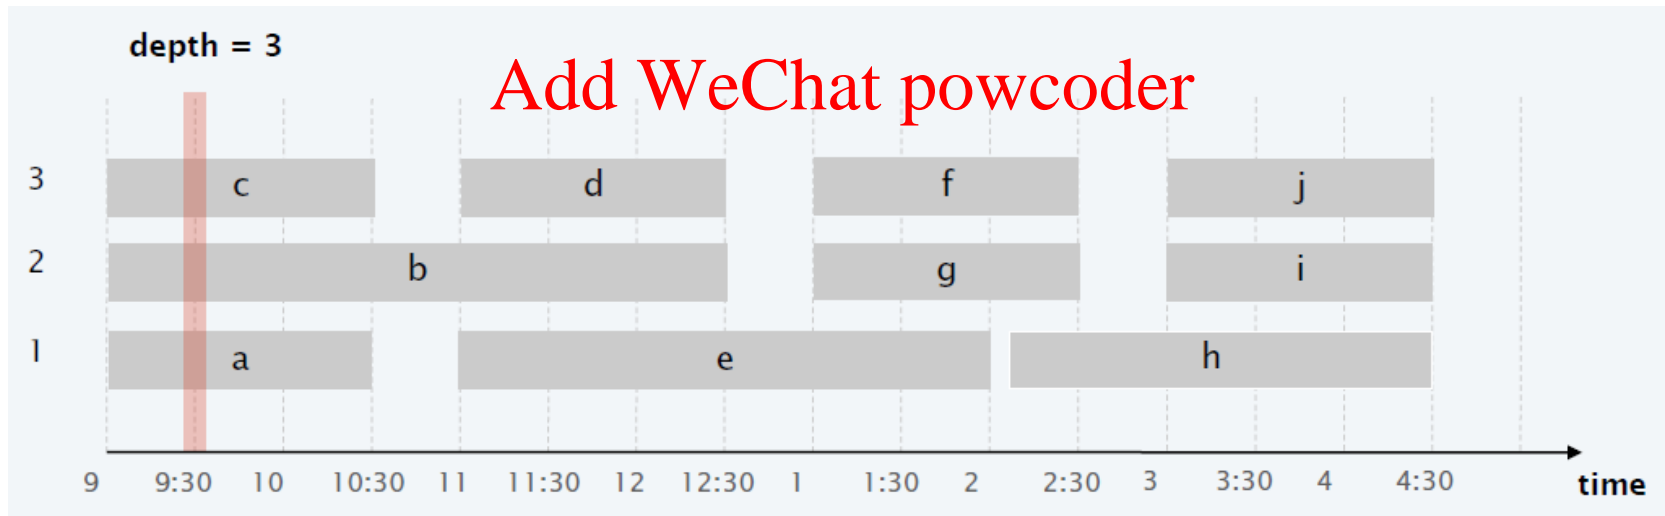

- Proof of optimality (lower bound)

- # classrooms needed  $\geq$  maximum “depth” at any point

- depth = number of lectures running at that time

- We now show that our greedy algorithm uses only these many classrooms!

<https://powcoder.com>

# Assignment Project Exam Help

## Interval Partitioning

- **Proof of optimality (upper bound)**
  - Let  $d$  = # classrooms used by greedy
  - Classroom  $d$  was opened because there was a schedule  $j$  which was incompatible with some lectures already scheduled in each of  $d - 1$  other classrooms
  - All these  $d$  lectures end after  $s_j$
  - Since we sorted by start time, they all start at/before  $s_j$
  - So at time  $s_j$ , we have  $d$  mutually overlapping lectures
  - Hence,  $\text{depth} \geq d$
  - So all schedules use  $\geq d$  classrooms. ■

# Interval Graphs

Add WeChat powcoder

- Interval scheduling and interval partitioning can be seen as graph problems

Assignment Project Exam Help

- Input

- Graph  $G = (V, E)$
- Vertices  $V$  = jobs/lectures
- Edge  $(i, j) \in E$  if jobs  $i$  and  $j$  are incompatible

<https://powcoder.com>

Add WeChat powcoder

- Interval scheduling = maximum independent set (MIS)
- Interval partitioning = graph colouring

# Interval Graphs

Add WeChat powcoder

- MIS and graph colouring are NP-hard for general graphs
- But they're efficiently solvable for "interval graphs"
  - Graphs which can be obtained from incompatibility of intervals
  - In fact, this holds even when we are not given an interval representation of the graph
- Can we extend this result further?
  - Yes! Chordal graphs
    - Every cycle with 4 or more vertices has a chord

# Assignment Project Exam Help

## Minimizing Lateness

Add WeChat powcoder

- Problem

- We have a single machine
- Each job  $j$  requires  $t_j$  units of time and is due by time  $d_j$
- If it's scheduled to start at  $s_j$ , it will finish at  $f_j = s_j + t_j$
- Lateness:  $\ell_j = \max\{0, f_j - d_j\}$
- **Goal:** minimize the maximum lateness,  $L = \max_j \ell_j$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

- Contrast with interval scheduling

- We can decide the start time
- There are soft deadlines

# Assignment Project Exam Help

# Minimizing Lateness

Add WeChat powcoder

- Example

Input

	1	2	3	4	5	6
$t_j$	3	2	1	4	3	2
$d_j$	6	8	9	5	14	15

Add WeChat powcoder

An example schedule

# Assignment Project Exam Help

## Minimizing Lateness

Add WeChat powcoder

- Let's go back to greedy template
  - Consider jobs one-by-one in some “natural” order
  - Schedule jobs in this order (nothing special to do here, since we have to schedule all jobs and there is only one machine available)
- Natural orders?
  - Shortest processing time first: ascending order of processing time  $t_j$
  - Earliest deadline first: ascending order of due time  $d_j$
  - Smallest slack first: ascending order of  $d_j - t_j$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Assignment Project Exam Help

## Minimizing Lateness

Add WeChat powcoder

- Counterexamples

- Shortest processing time first

- Ascending order of processing time  $t_j$

<https://powcoder.com>

	1	2
$t_j$	1	10
$d_j$	100	10

Add WeChat powcoder

- Smallest slack first

- Ascending order of  $d_j - t_j$

	1	2
$t_j$	1	10
$d_j$	2	10

# Assignment Project Exam Help

## Minimizing Lateness

Add WeChat powcoder

- By now, you should know what's coming...  
 $\text{EARLIESTDEADLINEFIRST}(n, t_1, t_2, \dots, t_n, d_1, d_2, \dots, d_n)$ 

---

Assignment Project Exam Help

Some  $n$  jobs so that  $d_1 \leq d_2 \leq \dots \leq d_n$ .

$t \leftarrow 0$   
 $\text{FOR } j = 1 \text{ TO } n$   
 $\text{Add job } j \text{ to interval } [t, t + t_j].$   
 $s_j \leftarrow t; f_j \leftarrow t + t_j$   
 $t \leftarrow t + t_j$   
 $\text{RETURN intervals } [s_1, f_1], [s_2, f_2], \dots, [s_n, f_n].$ 

---
- We'll prove that earliest deadline first works!

# Assignment Project Exam Help

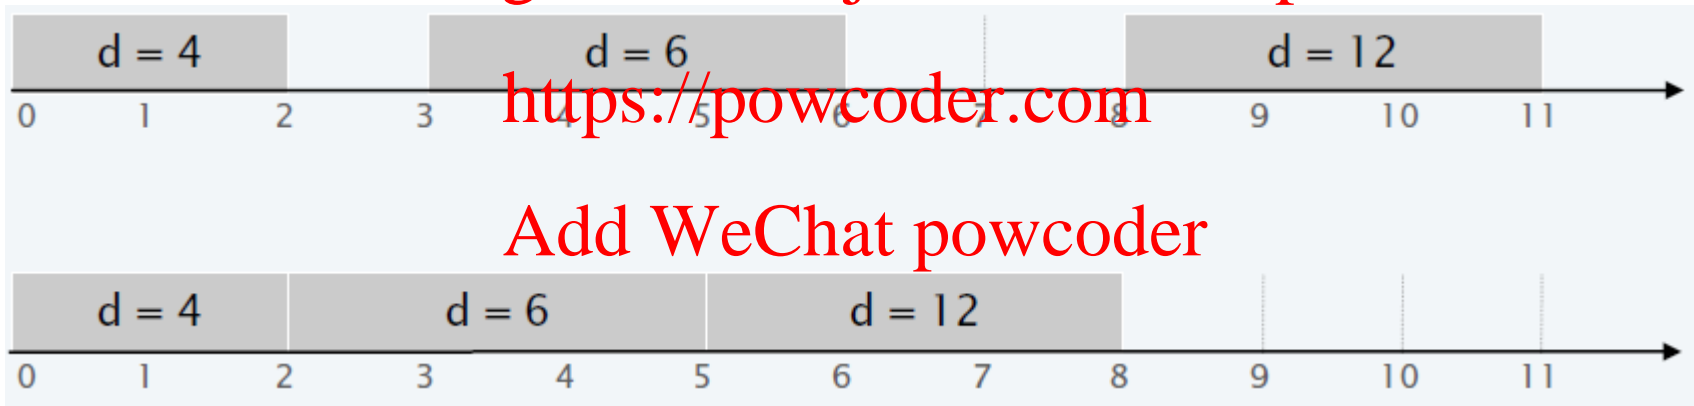

## Minimizing Lateness

Add WeChat powcoder

- Observation 1

- There is an optimal schedule with no idle time

Assignment Project Exam Help

# Assignment Project Exam Help

# Minimizing Lateness

Add WeChat powcoder

- Observation 2

- Earliest deadline first has no idle time

- Let us define an inversion

- $(i, j)$  such that  $d_i < d_j$  but  $j$  is scheduled before  $i$

- Observation 3

- By definition, earliest deadline first has no inversions

- Observation 4

- If a schedule with no idle time has an inversion, it has a pair of inverted jobs scheduled consecutively

# Assignment Project Exam Help

## Minimizing Lateness

Add WeChat powcoder

- Observation 5

- Swapping adjacently scheduled inverted jobs doesn't increase lateness but reduces #inversions by one

Assignment Project Exam Help

- Proof

- Let  $L$  and  $L'$  denote lateness before/after swap
- Clearly,  $\ell_k = \ell'_k$  for all  $k \neq i, j$
- Also, clearly,  $\ell'_i \leq \ell_i$

<https://powcoder.com>

Add WeChat powcoder

# Assignment Project Exam Help

## Minimizing Lateness

Add WeChat powcoder

### • Observation 5

- Swapping adjacently scheduled inverted jobs doesn't increase lateness but reduces #inversions by one

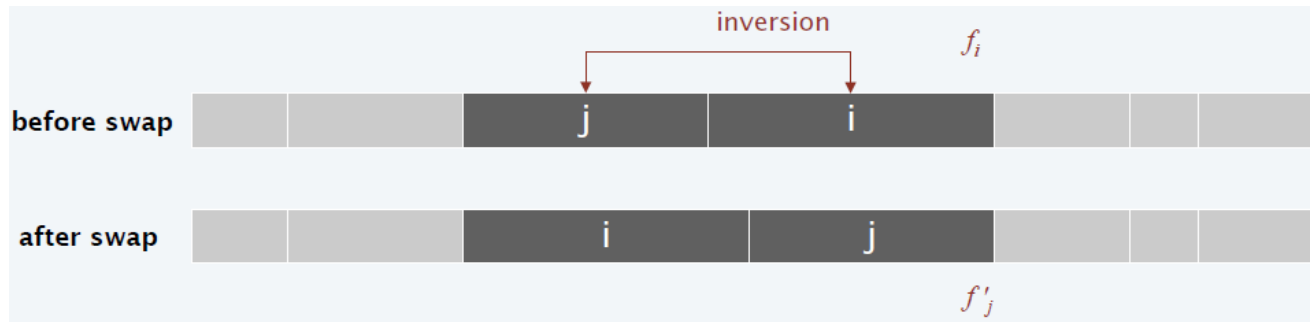

Assignment Project Exam Help

### • Proof

- $\ell'_j = f'_j - d_j = f_i - d_j \leq f_i - d_i = \ell_i$
- $L' = \max \{ \ell'_i, \ell'_j, \max_{k \neq i,j} \ell'_k \} \leq \max \{ \ell_i, \ell_j, \max_{k \neq i,j} \ell_k \} \leq L$

<https://powcoder.com>

Add WeChat powcoder

# Assignment Project Exam Help

## Minimizing Lateness

Add WeChat powcoder

- Observation 5

- Swapping adjacently scheduled inverted jobs doesn't increase lateness but reduces #inversions by one

Assignment Project Exam Help

- Proof

- Check that swapping an adjacent inverted pair reduces the total #inversions by one

<https://powcoder.com>

Add WeChat powcoder

# Minimizing Lateness

Add WeChat powcoder

- **Proof of optimality of earliest deadline first**
  - Suppose for contradiction that it's not optimal
  - Consider an optimal schedule  $S^*$  with fewest inversions among all optimal schedules
    - WLOG, suppose it has no idle time
  - Because EDF is not optimal,  $S^*$  has inversions
  - By Observation 4, it has an adjacent inversion  $(i, j)$
  - By Observation 5, swapping the adjacent pair keeps the schedule optimal but reduces the #inversions by 1
  - Contradiction! ■

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Assignment Project Exam Help

# Lossless Compression

Add WeChat powcoder

- Problem

- We have a document that is written using  $n$  distinct labels
- Naïve encoding: represent each label using  $\log n$  bits
- If the document has length  $m$ , this uses  $m \log n$  bits

<https://powcoder.com>

- English document with no punctuations etc.
- $n = 26$ , so we can use 5 bits
  - $a = 00000$
  - $b = 00001$
  - $c = 00010$
  - $d = 00011$
  - ...

# Assignment Project Exam Help

# Lossless Compression

Add WeChat powcoder

- Is this optimal?

- What if  $a, e, r, s$  are much more frequent in the document than  $x, q, z$ ?
- Can we assign shorter codes to more frequent letters?

<https://powcoder.com>

- Say we assign...

- $a = 0, b = 1, c = 01, \dots$
- See a problem?
  - What if we observe the encoding '01'?
  - Is it 'ab'? Or is it 'c'?

# Lossless Compression

Add WeChat powcoder

- To avoid conflicts, we need a *prefix-free encoding*

- Map each label  $x$  to a bit-string  $c(x)$  such that for all distinct labels  $x$  and  $y$ ,  $c(x)$  is not a prefix of  $c(y)$

- Then it's impossible to have a scenario like this

- So we can read left to right

- Whenever the part to the left becomes a valid encoding, greedily decode it, and continue with the rest

# Assignment Project Exam Help

# Lossless Compression

Add WeChat powcoder

- Formal problem

- Given  $n$  symbols and their frequencies  $(w_1, \dots, w_n)$ , find a prefix-free encoding with lengths  $(\ell_1, \dots, \ell_n)$  assigned to the symbols which minimizes  $\sum_{i=1}^n w_i \cdot \ell_i$

- Note that  $\sum_{i=1}^n w_i \cdot \ell_i$  is the length of the compressed document

<https://powcoder.com>

- Example

Add WeChat powcoder

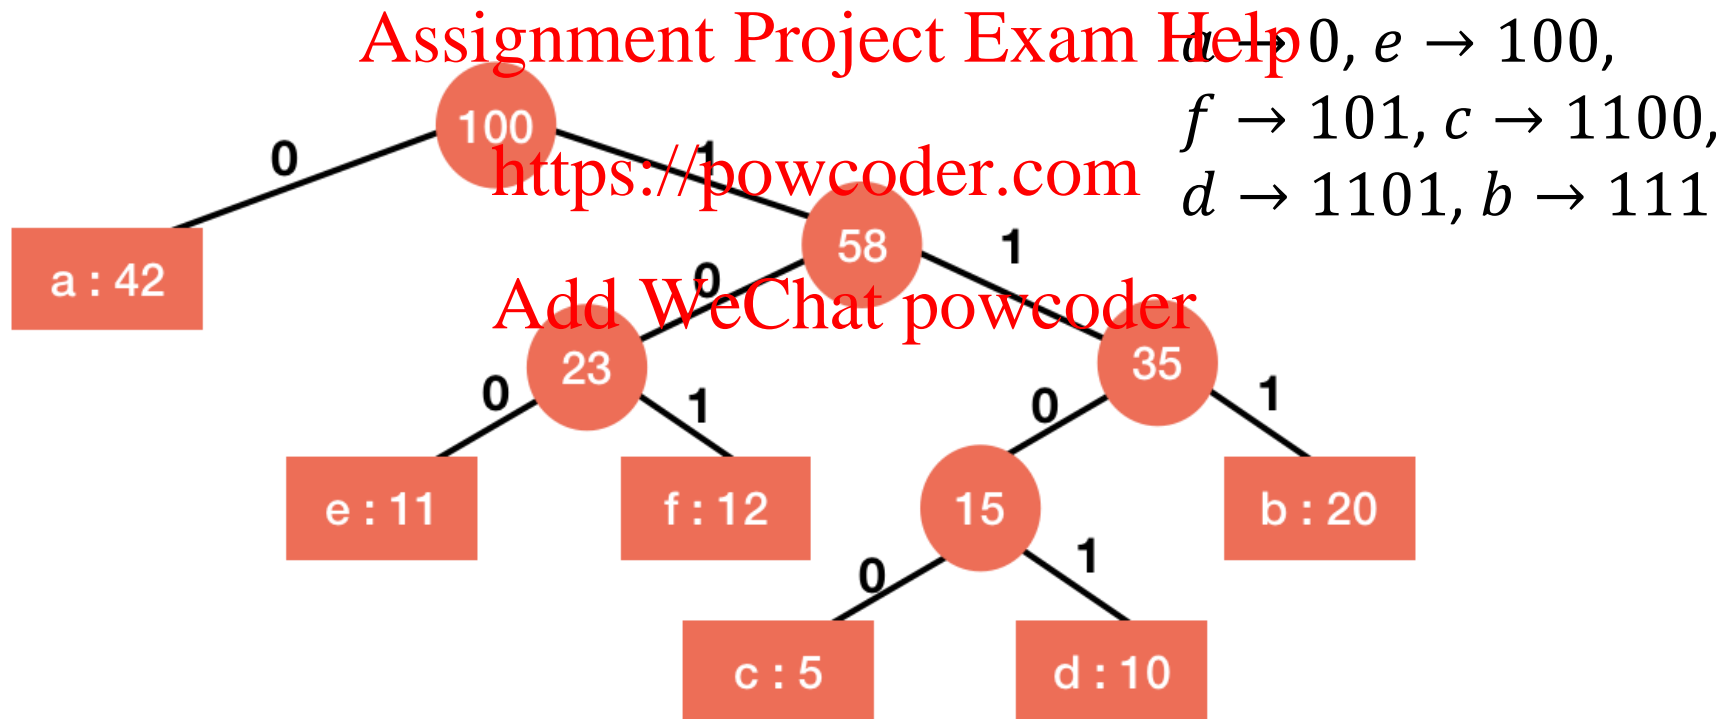

- $(w_a, w_b, w_c, w_d, w_e, w_f) = (42, 20, 5, 10, 11, 12)$
- No need to remember the numbers 😊

# Assignment Project Exam Help

# Lossless Compression

Add WeChat powcoder

- **Observation:** prefix-free encoding = tree

# Assignment Project Exam Help

# Lossless Compression

Add WeChat powcoder

- Huffman Coding

- Build a priority queue by adding  $(x, w_x)$  for each symbol  $x$
  - While  $|queue| \geq 2$ 
    - Take the two symbols with the lowest weight  $(x, w_x)$  and  $(y, w_y)$
    - Merge them into one symbol with weight  $w_x + w_y$
- Assignment Project Exam Help
- <https://powcoder.com>

- Let's see this on the previous example

# Lossless Compression

Add WeChat powcoder

- Final Outcome

$a \rightarrow 0, e \rightarrow 100,$   
 $f \rightarrow 101, c \rightarrow 1100,$   
 $d \rightarrow 1101, b \rightarrow 111$

# Assignment Project Exam Help

# Lossless Compression

Add WeChat powcoder

- Running time

- $O(n \log n)$
- Can be made  $O(n)$  if the labels are given to you sorted by their frequencies
  - Exercise! Think of using two queues...

- Proof of optimality

- Induction on the number of symbols  $n$
- **Base case:** For  $n = 2$ , both encodings which assign 1 bit to each symbol are optimal
- **Hypothesis:** Assume it returns an optimal encoding with  $n - 1$  symbols

# Assignment Project Exam Help

# Lossless Compression

Add WeChat powcoder

- Proof of optimality

- Consider the case of  $n$  symbols

- **Lemma 1:** If  $w_x < w_y$ , then  $\ell_x \geq \ell_y$  in any optimal tree.

<https://powcoder.com>

- **Proof:**

- Suppose for contradiction that  $w_x < w_y$  and  $\ell_x < \ell_y$ .
    - Swapping  $x$  and  $y$  strictly reduces the overall length as  $w_x \cdot \ell_y + w_y \cdot \ell_x < w_x \cdot \ell_x + w_y \cdot \ell_y$  (check!)
    - QED!

# Assignment Project Exam Help

# Lossless Compression

Add WeChat powcoder

- Proof of optimality

- Consider the two symbols  $x$  and  $y$  with lowest frequency which Huffman combines in the first step

- **Lemma 2:**  $\exists$  optimal tree  $T$  in which  $x$  and  $y$  are siblings (i.e. for some  $p$ , they are assigned encodings  $p0$  and  $p1$ ).

- **Proof:**

1. Take any optimal tree
2. Let  $x$  be the label with the lowest frequency.
3. If  $x$  doesn't have the longest encoding, swap it with one that has
4. Due to optimality,  $x$  must have a sibling (check!)
5. If it's not  $y$ , swap it with  $y$
6. Check that Steps 3 and 5 do not change the overall length. ■

# Assignment Project Exam Help

# Lossless Compression

Add WeChat powcoder

- Proof of optimality

- Let  $x$  and  $y$  be the two least frequency symbols that Huffman combines in the first step into “ $xy$ ”
- Let  $H$  be the Huffman tree produced
- Let  $T$  be an optimal tree in which  $x$  and  $y$  are siblings
- Let  $H'$  and  $T'$  be obtained from  $H$  and  $T$  by treating  $xy$  as one symbol with frequency  $w_x + w_y$
- Induction hypothesis:  $Length(H') \leq Length(T')$
- $Length(H) = Length(H') + (w_x + w_y) \cdot 1$
- $Length(T) = Length(T') + (w_x + w_y) \cdot 1$
- So  $Length(H) \leq Length(T)$  ■
